Setting up Keyboard Shortcuts in Dreamweaver MX

The following tutorial is taken from instructions for setting up the X-keys Professional Keyboard for Dreamweaver MX. Programming the keyboard shortcuts into an X-keys gives you a single, custom key for these functions.

We use the "Code View" command for this tutorial, but any command in Dreamweaver's menu may be used following the same steps.

### ► **Step 1** - **Open the Edit Menu and Select "Keyboard Shortcuts"**

The "Keyboard Shortcuts" window will open and display your current settings.
If you have not created a new keyboard shortcut before, clicking on the "Change" button will prompt the following message:
"The current factory set cannot be modified. To create a modifiable set, click OK to duplicate the current set"

Click OK and give your new set a name.

If you have already created a custom set of keyboard shortcuts, just add the following changes.

► Step 2 - In the Commands Window, select "View" and "Code"

► Step 3 - Click in the "Press Key" Field
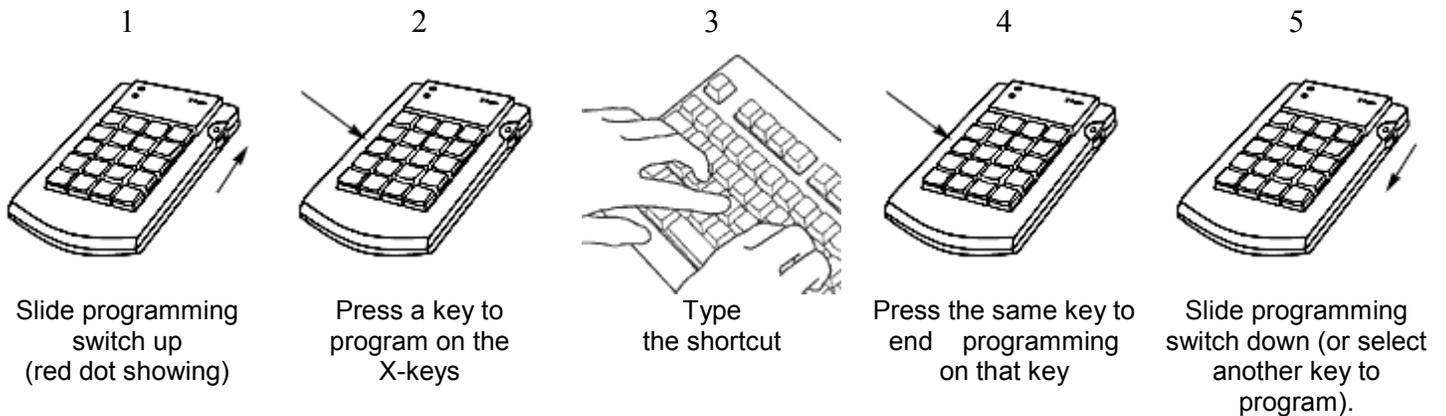

► Step 4 - Enter the shortcut key combination

► Step 5 - Click the "Change" Button

The shortcut will appear in the shortcuts window and to the right of "Code" in the command window.

► Step 6 - Click OK to save your new settings

You may follow the same steps in this tutorial to create keyboard shortcuts for any menu item in Dreamweaver MX and then program the shortcut into any key on your X-keys. We recommend creating the keyboard shortcut in Dreamweaver MX first to avoid conflicts with existing keyboard shortcuts.

Setting a keyboard shortcut on an X-keys Programmable Keyboard

1	2	3	4	5
Slide programming switch up (red dot showing)	Press a key to program on the X-keys	Type the shortcut	Press the same key to end programming on that key	Slide programming switch down (or select another key to program).
